

Question 1: Calculate how much (%) is the effect of applying different modifications (changing the gas, adding an extra pane, using a low emissivity coating) on the U value with respect to a benchmark case of double layer with air and no coating ?

The gap thickness to be 13 mm:

$$U_{\text{window}} = U_{\text{center}} A_{\text{center}} + U_{\text{edge}} A_{\text{edge}} + U_{\text{frame}} A_{\text{frame}} / A_{\text{window}}$$

If it is a double – pane window, disregard the thermal resistances of glass layers,

With double pane glazing: (when $e = 0.10$):

- U factor (krypton) when using Krypton = 1.4 $\text{W/m}^2\text{K}$
- U factor (Argon) = 1.5 $\text{W/m}^2\text{K}$ when $e = 0.84$
- U factor of Krypton and Argon = 2.1 $\text{W/m}^2\text{K}$
- U factor of the air is 2.3 $\text{W/m}^2\text{K}$

With triple pane glazing: (when $e = 0.10$):

- U factor (Krypton) = 0.7 $\text{W/m}^2\text{K}$
- U factor (Argon) = 0.8 $\text{W/m}^2\text{K}$ when $e = 0.84$
- U factor of Krypton and Argon = 1.6 $\text{W/m}^2\text{K}$
- U factor of the air is 1.8 $\text{W/m}^2\text{K}$

Question2: Consider the house that we analyzed in the last two examples, calculate the heating and cooling load of the other windows which are fixed 14.4 m^2 on the west, fixed 3.6 m^2 on the south and an operable 3.6 m^2 on the south (the same window and frame type). How much does the total value change if I change the frame of the window from wooden one to aluminum ?

From the Table we gathered that:

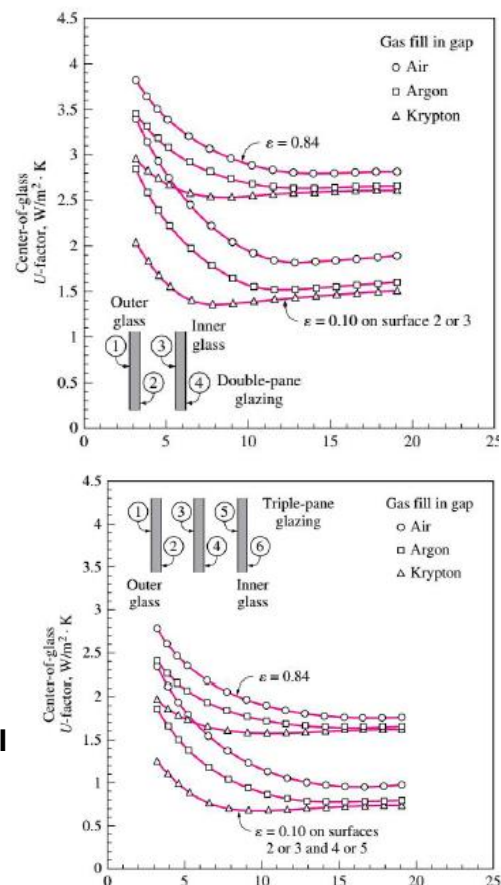

1. Net area of a building located in Piacenza is 105.8 m^2 , and the calculated U value is 0.438 $\text{W/m}^2\text{K}$ for the winter while in the summer it is 0.435 $\text{W/m}^2\text{K}$

2. A fixed heat absorbing double later glass with a wooden frame window at the east side of a building located in Piacenza has a surface of 14.4 m^2

3. $\Delta T_{\text{cooling}} = 24^\circ\text{C}$ 4. $\Delta T_{\text{heating}} = 20^\circ\text{C}$

Hence:

- $\Delta T_{\text{cooling}} = 31.9^\circ\text{C} - 24^\circ\text{C} = 7.9^\circ\text{C} = 7.9\text{K}$
- $\Delta T_{\text{heating}} = 20^\circ\text{C} - (-4.8^\circ\text{C}) = 24.8^\circ\text{C} = 24.8\text{K}$
- From the table we get that $\text{DR} = 11.9^\circ\text{C} = 11.9\text{K}$

To calculate the cooling load of the fixed window on the West:

- $q_{\text{west window}} = A \times CF_{\text{west window}}$
- $A = 14.4 \text{ m}^2$ $CF_{\text{west window}} = U_{\text{west window}}(\Delta T_{\text{cooling}} - 0.46DR)$
- $U_{\text{west window}} = 2.84 \text{ W/m}^2\text{K}$
- $CF_{\text{west window}} = 2.84 \text{ W/m}^2\text{K} \times (7.9\text{K} - 0.46 \times 11.9\text{K}) = 6.89 \text{ W/m}^2\text{K}$
- $PXI_{\text{west window}} = ED + Ed = 599 + 188 = 747$ $SHGC = 0.54$
- No internal shading:
- $IAC = 1$ $FF_s = 0.56$ $CF_{\text{west window}} = PXI \times SHGC \times IAC \times FF_s$
- $q_{\text{west window}} = A \times CF_{\text{west window}} = A \times (CF_{\text{heat transfer}} + CF_{\text{irradiation}})$
 $\approx 14.4 \text{ m}^2 \times (6.89 + 747 \times 0.54 \times 1 \times 0.56) \text{ W/m}^2 \approx 3352 \text{ W}$

To calculate the heating load of the fixed window on the west

$$q_{\text{west window}} = A \times HF_{\text{west window}} = A \times U_{\text{west window}} \Delta T_{\text{heating}} = 14.4 \text{ m}^2 \times 2.84 \text{ W/m}^2\text{K} \times 24.8 \text{ K} \approx 1014.22 \text{ W}$$

If the frames were made of aluminum:

- $U_{\text{west window}} = 3.61 \text{ W/m}^2\text{K}$
- $SHGC = 0.56$ $CF'_{\text{west window for heat transfer}} = U'_{\text{west window}} \times (\Delta T_{\text{cooling}} - 0.46DR)$
 $= 3.61 \text{ W/m}^2\text{K} \times (7.9\text{K} - 0.46 \times 11.9\text{K}) \approx 8.76 \text{ W/m}^2$
- **Cooling load** $q'_{\text{west window}} = A \times CF'_{\text{west window}} =$
 $A \times (CF'_{\text{west window for heat transfer}} + CF'_{\text{west window irradiation}} \approx 14.4 \text{ m}^2 \times (8.76 + 747 \times 0.54 \times 1 \times 0.56)$
 $\text{W/m}^2 \approx 3499.48 \text{ W}$
- **Heating load** $q'_{\text{west window}} = A \times HF'_{\text{west window}} = A \times U'_{\text{west window}} \Delta T_{\text{heating}}$
 $= 14.4 \text{ m}^2 \times 3.61 \text{ W/m}^2\text{K} \times 24.8 \text{ K} \approx 1289.2 \text{ W}$

Calculating the cooling load of the fixed window on the south:

$$q_{\text{west window}} = A \times CF_{\text{south window}}$$

$$A = 3.6 \text{ m}^2$$

$$CF_{\text{south window}} = U_{\text{south window}}(\Delta T_{\text{cooling}} - 0.46DR)$$

$$U_{\text{south window}} = 2.84 \text{ W/m}^2\text{K}$$

$$PXI_{\text{south window}} = ED + Ed = 348 + 209 = 577$$

$$SHGC = 0.54$$

$$\text{No internal shading so } IAC = 1 \text{ } FF_s = 0.47 \text{ } CF_{\text{south window}} = PXI \times SHGC \times IAC \times FF_s$$

$$q_{\text{south window}} = A \times CF_{\text{south window}} = A \times (CF_{\text{heat transfer}} + CF_{\text{irradiation}})$$

$$\approx 3.6 \text{ m}^2 \times (6.89 + 557 \times 0.54 \times 1 \times 0.47) \text{ W/m}^2 \approx 553.72 \text{ W}$$

To calculate the heating load of the fixed window on the south

$$q_{\text{south window}} = A \times HF_{\text{south window}} = A \times U_{\text{south window}} \Delta T_{\text{heating}}$$

$$= 3.6 \text{ m}^2 \times 2.84 \text{ W/m}^2\text{K} \times 24.8 \text{ K} \approx 253.56 \text{ W}$$

If the frames were made of aluminum: $U_{\text{south window}} = 3.61 \text{ W/m}^2\text{K}$ and $SHGC = 0.56$
 $CF'_{\text{south window for heat transfer}} = U'_{\text{south window}} \times (\Delta T_{\text{cooling}} - 0.46DR) = 3.61 \text{ W/m}^2\text{K}$
 $\times (7.9\text{K} - 0.46 \times 11.9\text{K}) \approx 8.76 \text{ W/m}^2$

- Cooling load $q'_{\text{south window}} = A \times CF'_{\text{south window}} = A \times (CF'_{\text{south window for heat transfer}} + CF'_{\text{south window irradiation}} \approx 3.6 \text{ m}^2 \times (8.76 + 557 \times 0.56 \times 1 \times 0.47)$
 $\text{W/m}^2 \approx 559.3 \text{ W}$

- Heating load $q'_{\text{southwindow}} = A \times HF'_{\text{southwindow}} = A \times U'_{\text{southwindow}} \Delta T_{\text{heating}}$
 $= 3.6 \text{ m}^2 \times 3.61 \text{ W/m}^2\text{K} \times 24.8 \text{ K} \approx 322.3 \text{ W}$

To calculate the cooling load of the operable window on the South:

$$q_{\text{south window}} = A \times CF_{\text{southwindow}}$$

$$A = 3.6 \text{ m}^2 \quad CF_{\text{southwindow}} = U_{\text{southwindow}} (\Delta T_{\text{cooling}} - 0.46 \text{ DR})$$

$$P_{\text{XI southwindow}} = ED + Ed = 348 + 209 = 557$$

$$\text{SHGC} = 0.54$$

$$\text{No internal shading so } IAC = 1 \quad FF_s = 0.47 \quad CF_{\text{southwindow}} = P_{\text{XI}} \times \text{SHGC} \times IAC \times FF_s$$

$$q_{\text{southwindow}} = A \times CF_{\text{southwindow}} = A \times (CF_{\text{heat transfer}} + CF_{\text{irradiation}})$$

$$\approx 3.6 \text{ m}^2 \times (6.89 + 557 \times 0.54 \times 1 \times 0.47) \text{ W/m}^2 \approx 553.72 \text{ W}$$

To calculate the heating load of the fixed window on the south

$$q_{\text{southwindow}} = A \times HF_{\text{southwindow}} = A \times U_{\text{southwindow}} \Delta T_{\text{heating}} = 3.6 \text{ m}^2 \times 2.84 \text{ W/m}^2\text{K} \times 24.8 \text{ K} \approx 253.56 \text{ W}$$

If the frames were made of aluminum: $U_{\text{southwindow}} = 3.61 \text{ W/m}^2\text{K}$ and $\text{SHGC} = 0.56$

$$CF'_{\text{southwindow for heat transfer}} = U'_{\text{south window}} \times (\Delta T_{\text{cooling}} - 0.46 \text{ DR}) = 3.61 \text{ W/m}^2\text{K}$$

$$\times (7.9 \text{ K} - 0.46 \times 11.9 \text{ K}) \approx 8.76 \text{ W/m}^2$$

- Cooling load $q'_{\text{southwindow}} = A \times CF'_{\text{southwindow}} = A \times (CF'_{\text{southwindow for heat transfer}} + CF'_{\text{southwindow irradiation}})$
 $\approx 3.6 \text{ m}^2 \times (8.76 + 557 \times 0.56 \times 1 \times 0.47) \text{ W/m}^2 \approx 559.3 \text{ W}$
- Heating load $q'_{\text{southwindow}} = A \times HF'_{\text{southwindow}} = A \times U'_{\text{southwindow}} \Delta T_{\text{heating}}$
 $= 3.6 \text{ m}^2 \times 3.61 \text{ W/m}^2\text{K} \times 24.8 \text{ K} \approx 322.3 \text{ W}$

To calculate the cooling load of the operable window on the South:

$$q_{\text{south window}} = A \times CF_{\text{southwindow}}$$

$$A = 3.6 \text{ m}^2 \quad CF_{\text{southwindow}} = U_{\text{southwindow}} (\Delta T_{\text{cooling}} - 0.46 \text{ DR})$$

$$U_{\text{westwindow}} = 2.87 \text{ W/m}^2\text{K}$$

$$CF_{\text{westwindow}} = 2.87 \text{ W/m}^2\text{K} \times (7.9 \text{ K} - 0.46 \times 11.9 \text{ K}) = 6.96 \text{ W/m}^2\text{K}$$

$$P_{\text{XI westwindow}} = ED + Ed = 348 + 209 = 557$$

$$\text{SHGC} = 0.46$$

$$\text{No internal shading so } IAC = 1 \quad FF_s = 0.47 \quad CF_{\text{southwindow}} = P_{\text{XI}} \times \text{SHGC} \times IAC \times FF_s$$

$$q_{\text{southwindow}} = A \times CF_{\text{southwindow}} = A \times (CF_{\text{heat transfer}} + CF_{\text{irradiation}})$$

$$\approx 3.6 \text{ m}^2 \times (6.89 + 557 \times 0.46 \times 1 \times 0.47) \text{ W/m}^2 \approx 458.58 \text{ W}$$

To calculate the heating load of the operable window on the south

$$q_{\text{southwindow}} = A \times HF_{\text{southwindow}} = A \times U_{\text{southwindow}} \Delta T_{\text{heating}}$$

$$= 3.6 \text{ m}^2 \times 2.87 \text{ W/m}^2\text{K} \times 24.8 \text{ K} \approx 256.23 \text{ W}$$

If the frames were made of aluminum:

- $U_{\text{westwindow}} = 4.062 \text{ W/m}^2\text{K}$ and $\text{SHGC} = 0.55$ $CF'_{\text{westwindow for heat transfer}} = U'_{\text{west window}} \times (\Delta T_{\text{cooling}} - 0.46 \text{ DR}) = 4.62 \text{ W/m}^2\text{K}$
 $\times (7.9 \text{ K} - 0.46 \times 11.9 \text{ K}) \approx 11.21 \text{ W/m}^2$

- Cooling load $q'_{southwindow} = A \times CF'_{southwindow} = A \times (CF'_{southwindow} \text{ for heat transfer} + CF'_{southwindow} \text{ irradiation}) \approx 3.6m^2 \times (11.21 + 557 \times 0.55 \times 1 \times 0.47) Wm^2 \approx 558.7W$
- Heating load $q'_{westwindow} = A \times HF'_{southwindow} = A \times U'_{southwindow} \Delta T_{heating} = 3.6m^2 \times 4.62 Wm^2K \times 24.8K \approx 412.47 W$

$$U_{westwindow} = 2.87 Wm^2K$$

$$CF_{westwindow} = 2.87 Wm^2K \times (7.9K - 0.46 \times 11.9K) = 6.96 Wm^2K$$

$$P_{Xl_{westwindow}} = ED + Ed = 348 + 209 = 557$$

$$SHGC = 0.46$$

$$\text{No internal shading so } IAC = 1 \quad FF_s = 0.47 \quad CF_{southwindow} = P_{XI} \times SHGC \times IAC \times FF_s$$

$$q_{southwindow} = A \times CF_{southwindow} = A \times (CF_{heat transfer} + CF_{irradiation}) \approx 3.6m^2 \times (6.89 + 557 \times 0.46 \times 1 \times 0.47) Wm^2 \approx 458.58W$$

To calculate the heating load of the operable window on the south

$$q_{southwindow} = A \times HF_{southwindow} = A \times U_{southwindow} \Delta T_{heating} = 3.6m^2 \times 2.87 Wm^2K \times 24.8K \approx 256.23W$$

If the frames were made of aluminum:

$$U_{westwindow} = 4.06 Wm^2K \text{ and } SHGC = 0.55 \quad CF'_{westwindow} \text{ for heat transfer} = U'_{westwindow} \times (\Delta T_{cooling} - 0.46 DR) = 4.62 Wm^2K \times (7.9K - 0.46 \times 11.9K) \approx 11.21 Wm^2$$

- Cooling load $q'_{southwindow} = A \times CF'_{southwindow} = A \times (CF'_{southwindow} \text{ for heat transfer} + CF'_{southwindow} \text{ irradiation}) \approx 3.6m^2 \times (11.21 + 557 \times 0.55 \times 1 \times 0.47) Wm^2 \approx 558.7W$
- Heating load $q'_{westwindow} = A \times HF'_{southwindow} = A \times U'_{southwindow} \Delta T_{heating} = 3.6m^2 \times 4.62 Wm^2K \times 24.8K \approx 412.47 W$

The results show that a window with a wooden frame has a greater resistance in cooling and heating than a window with an aluminum frame.
