

1) Using the diagrams given in the presentation calculate how much (%) is the effect of applying different modifications (changing the gas, adding an extra pane, using a low emissivity coating) on the U value with respect to a benchmark case of double layer with air and no coating? (keep the gap thickness to be 13 mm)?

Soln: Benchmark:

With Double pane glazing ($\epsilon=0.84$) & gap thickness 13mm

U- Value of a double pane glazing window if the gap is filled with air is $2.8 \frac{W}{m^2 K}$

2) Consider the house that we analyzed in the last two examples, calculate the heating and cooling load of the other windows which are fixed 14.4 m² on the west, fixed 3.6 m² on the south and an operable 3.6 m² on the south (the same window and frame type). How much does the total value change if I change the frame of the window from wooden one to aluminum?
